

**A presentation on the
Fundamentals and Benefits
of CI/CD to Achieve, Build,
and Deploy Automation for
Cloud-Based Software
Products**

By Ufonabasi Uduak Umo

What is CI/CD

CI/CD is an abbreviation for continuous integration and continuous deployment: Continuous integration implies that new user stories in agile are built, tested, and integrated into the existing system. Maintaining the wholeness and the integrity of the software. Continuous deployment implies the automatic release of the new user stories in a central repository, meaning newly added features are available to the end-users.

Benefits of CI/CD

- Smaller code changes are simpler (more atomic) and have fewer unintended consequences.
- Better Code Quality
- Ensures Faster Time to Market (which reduces the time spent on shipping new updates)
- Increased Focus on Core Responsibilities
- Release cycles are shorter with targeted releases and this blocks fewer features that aren't ready for release

The cost of CI/CD

Because you are introducing automation to the system, CI/CD pipeline implementation will be expensive. Costly operations, rollouts, and training are the possible reasons for the rise in cost. Whether you use a SaaS or manage it yourself, these expenses will still be incurred. The up-front charges must be considered first. To reduce typical errors and increase the effectiveness of your CI/CD budget, there are also hidden expenditures that you should be aware of. Therefore it is better to start CI/CD immediately when you start any project in order to reduce the cost of implementation, because it is easier to automate at the start of the project than at the end of the project. Without CI/CD you'll need to pay QA testers to test the project which will incur an extra cost and time to the timeline of the project.

Thank you for listening
